Anmelden jedes.For almost every major software development project, there are good reasons to test early and often. By the time you're planning a major release, though, the stakes have become much higher. As deadlines approach, the pressure will only increase to release the product as quickly as possible. This has you rushing to deliver software that lacks automation and fails to properly address testability. The testing effort becomes more complicated and expensive as we get closer to a product's release. This is when you start to see things like the following bad practices: Short Release Cycles Get shorter and shorter as time runs out and the pressure to release builds. This makes it more and more difficult to write testable code and add features. Additionally, the top software developers who are on your team are often pulled away from their work to meet their own deadlines. Technology Changes Rely on developers to keep your existing infrastructure working. Your release is going to include software that may have been written by other developers that you may not have had experience with. Your developers will need time to educate themselves on how to handle these changes, but that may not happen. Release Cycles Get longer and longer. After a couple of years or even years, some "new" features stop being added, and the product becomes obsolete. You may need to add new features to keep up with your competition, but you may not have the time or resources to do so. And your users may be unwilling to put up with a product that's just "the same thing that they've always had." Regular Cleanup Over Time You may think that your release is perfect, but your team is going to find bugs in the software that you haven't anticipated. You should have a plan in place to identify and fix problems before release. However, you may have difficulty doing this because your team may not have enough time or enough resources to do this properly. If your team's work becomes backlogged, as is often the case
